radeon-fix

PRIVATE AI CODE-REPAIR AGENT ON AMD RADEON / ROCM

Track 2 | AMD AI DevMaster Hackathon 2026
Author: Hao Miao | Submission: 2026-08-05

One local model. Your code never leaves the machine.

Issue-driven repair for private repositories: paste a bug report, get an auditable patch.

CLI

```
$ radeon-fix --repo <path>
             --issue "..."
```

Output:

`patch.diff  report.md  trajectory.json`
`run.json  gpu.json (rocm-smi)`

Exit codes: 0 patch | 1 no patch | 2 fatal error

ARCHITECTURE

1. **Issue text**
   radeon-fix --repo --issue
2. **Temporary git clone**
   fresh workspace, repo untouched
3. **Aider Repo Map C1R1**
   2048-token map + one refresh
4. **Qwen3-14B BF16 on ROCm**
   local vLLM, loopback endpoint
5. **J3 xgrammar actions**
   Edit V2 exact replace
6. **V1R1 verifier**
   deterministic checks, <=1 repair

GPU PERFORMANCE ON gfx1100 (51.52 GB VRAM)

TTFT p50 104 ms
p95 137 ms; decode p50 25.7 tok/s (10-request probe)

Prefix cache 18x / 77x
TTFT 3976->219 ms at 4K; 43,568->562 ms at 16K

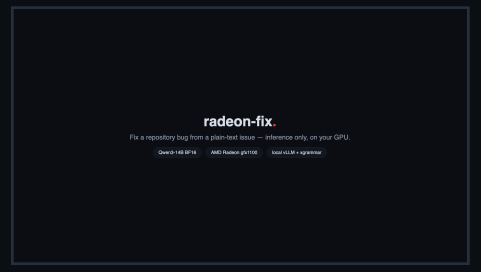

xgrammar 100% valid
189/189 structured actions schema-valid, zero JSON retries

Stable service
10/10 tool calls, 20/20 schema checks, 30/30 stability requests

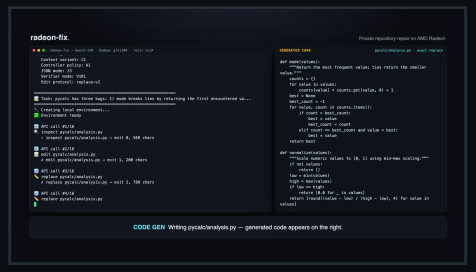

BF16 + INT8 KV
46.7 GB VRAM used, 32K context, no CPU offload

Agent-level: mean 1.92 min/task, P95 6.04 min
Dev gate: 5/5 patches, 5/5 applies, 38/38 valid actions

OUTPUT: patch.diff -> review -> git apply

1. Issue + workspace

2. Code generation in terminal

3. Patch + 7/7 tests pass
