AMD AI DEVMASTER HACKATHON 2026 / TRACK 2

PolicySeal

Minimum disclosure for the right recipient.
Local policy Agent on AMD Radeon.

One engine, three business documents

XLSX

Supplier comparison

Four recipients / 59 stable regions

Full disclosure action matrix

DOCX

Security incident report

Paragraph and table transformations

Stable asset aliases

TEXT PDF

Supplier contract

Position-aware preview

Traceable DOCX output

One sheet, four outcomes

Context is a policy input, not a note.

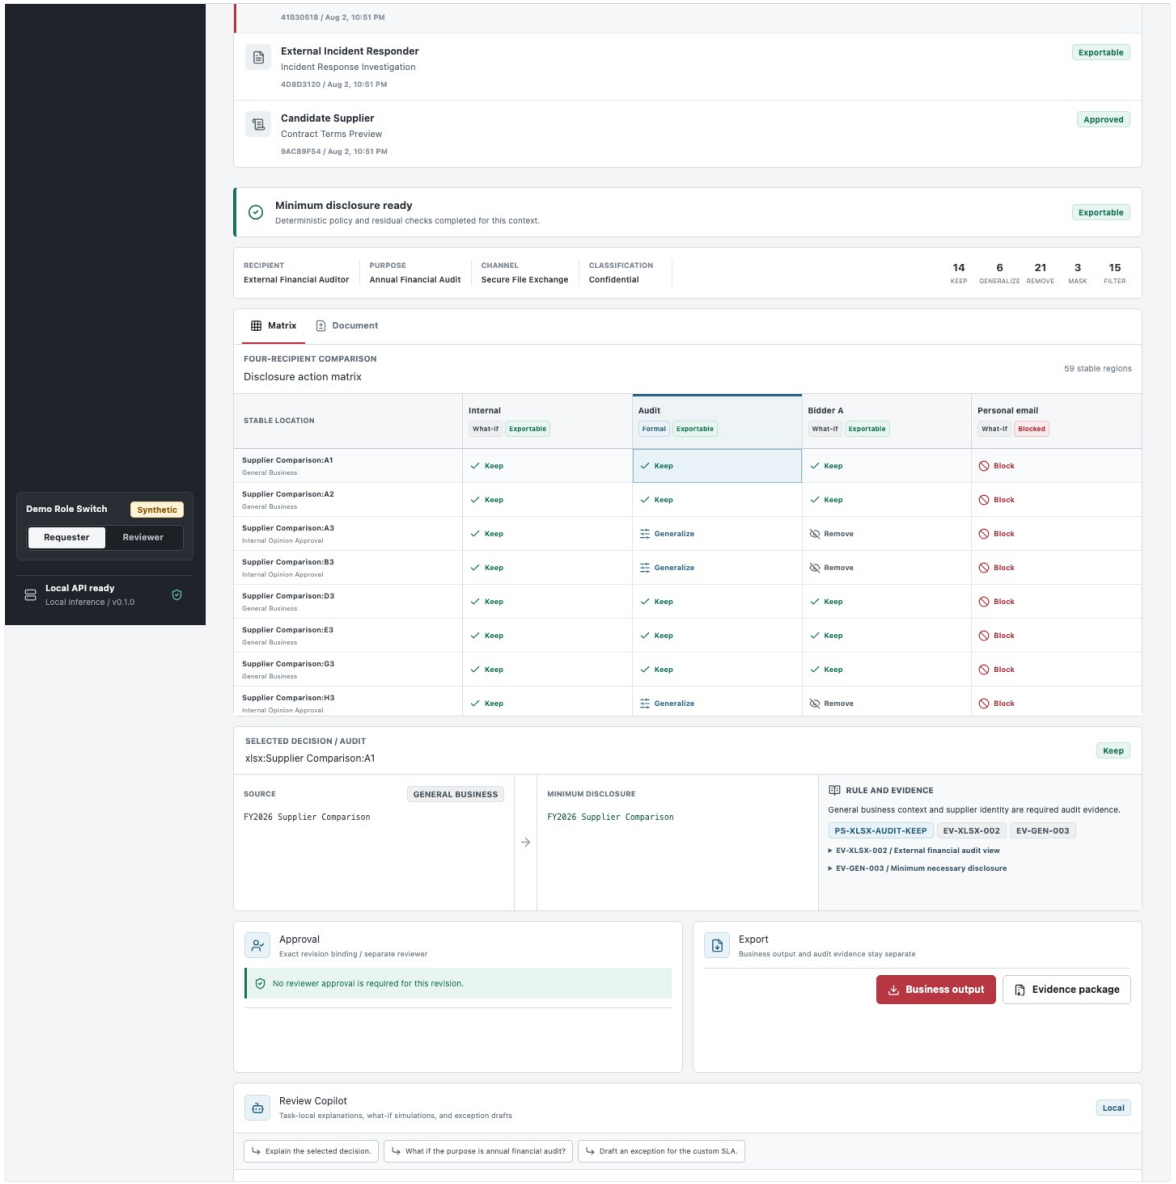

Internal keeps the evidence.

Audit keeps required facts while generalizing internal opinion.

Bidder A removes competitor-sensitive content.

Personal email blocks the entire export.

Every cell keeps a stable location, action, rule ID, reason, and policy version.

The Agent can reason; policy still decides

1 / UNDERSTAND

LLM ✦ tools

Classify uncertain semantics and retrieve cited local policy evidence.

2 / ENFORCE

Deterministic kernel

Apply versioned YAML rules. Block outranks Approval, Transform, and Keep.

3 / PROVE

Residual ✦ audit

Scan every output, bind approvals, and package rule-level evidence.

Approval stays task-bound

Copilot helps the reviewer without becoming the policy.

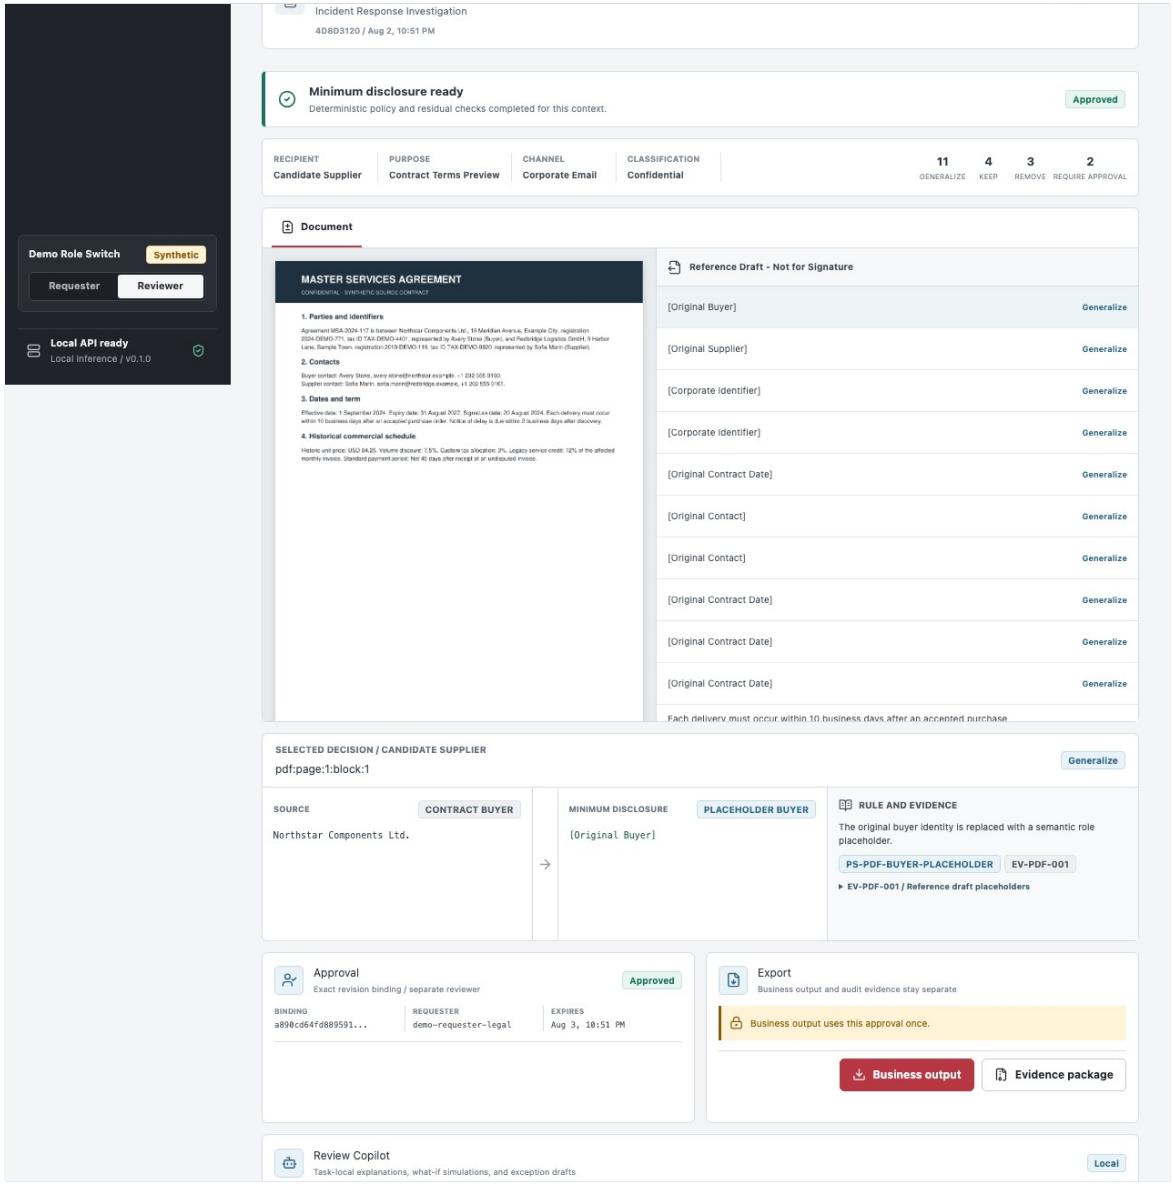

Explain a selected decision with rule and evidence citations.

Simulate another purpose without mutating the task.

Draft an exception request that enters approval.

Approval is revision-bound, use-bound, and separate from the business output.

A Block never becomes approvable.

The model runs locally on AMD Radeon

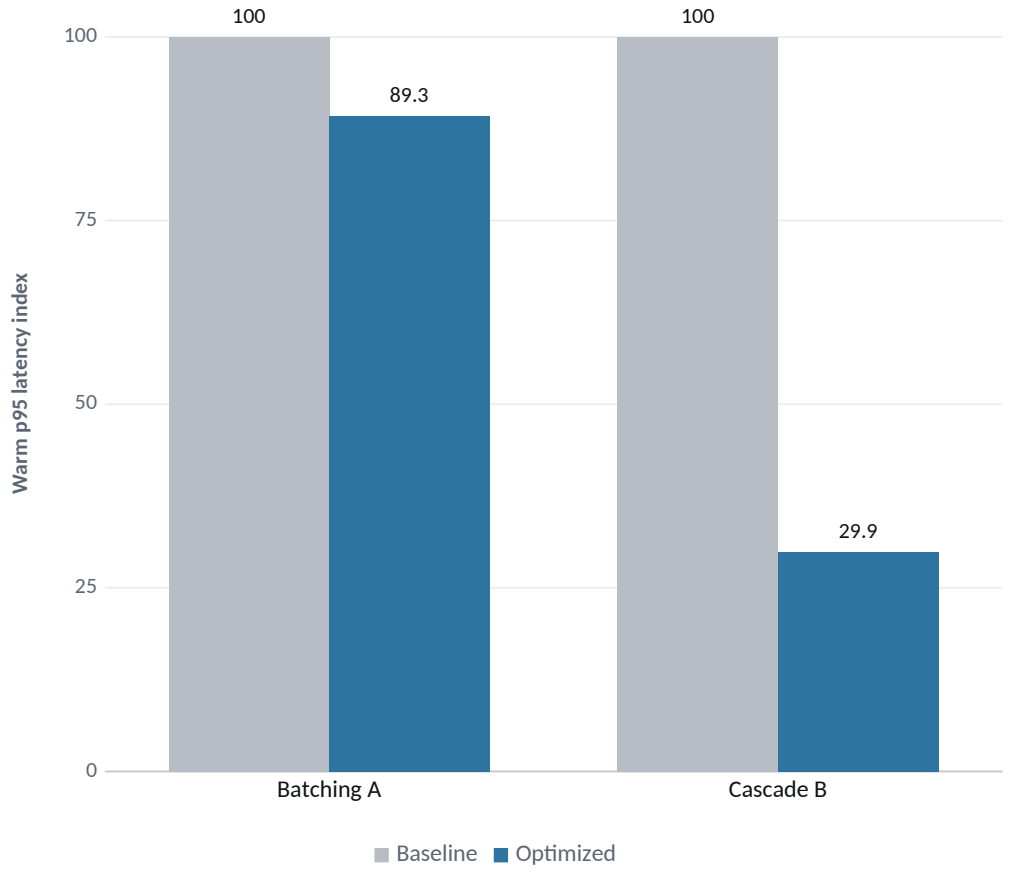

Local-only inference

FastAPI and the review UI call a localhost OpenAI-compatible vLLM endpoint. Source documents, policies, outputs, and audit evidence stay on the instance.

SSH tunnels expose only 127.0.0.1 during development.

GPU	AMD Radeon / gfx1100 / 48 GiB
STACK	ROCm 7.2.1 / vLLM / BF16
MODEL	Qwen3-8B / non-thinking
EVIDENCE	SHA-256 manifest + raw benchmark JSON

Measured on Radeon, including the target we missed

Two optimizations, one target met

Stable-ID batching improved warm p95 by 10.7%, below its 20% target. Deterministic short-circuit removed 70% of model regions while preserving the frozen goldens.

70%

model regions removed

0

high-risk leakage incidents

Ready to reproduce; honest about scope

Judge the workflow, not a mockup.

Reproduce with the documented local and Radeon commands. The submission includes setup scripts, model hashes, frozen goldens, and raw benchmark JSON.

P0 limits: text PDF only; no OCR, email sending, SSO, DRM, or automatic compliance claims.

- **30/30 frozen scenario checks**
- **179 backend tests**
- **4/4 Radeon cloud E2E**
- **Raw runtime evidence included**
- **wangjiachang**
